Algorithm for detecting noises from natural and technogenic origin

1) mapping data to wavelet space

$$(W_\Psi f)(b, a) = |a|^{-1/2} \int_{-\infty}^{\infty} f(t) \Psi\left(\frac{t-b}{a}\right) dt,$$

где Ψ – wavelet, $f \in L^2(R)$, $a, b \in R'$ $a \neq 0$, a – scale, b – time.

2) estimation of the intensity of interference on an informative scale

$$E_b = \sum_{a_i} e_{b,a_i},$$

$$e_{b,a_i} = |(W_\Psi f)(b, a_i)|.$$

3) noise isolation based on the use of adaptive values of threshold functions

$$P_{T_a}(E_b) = \begin{cases} 1, & \text{если } E_b > T_a \\ 0, & \text{если } E_b \leq T_a \end{cases}$$

где T_a – scale range threshold $1, \dots, a$. Value $P_{T_a}(E_b) = 1$ indicates the presence of noise.

The study used data of fluxgate magnetometer FGE-DTU measurements at Observatory Paratunka, Kamchatka, IKIR FEB RAS (2 Hz) for 2009-2019.

The work was carried out as part of the implementation of the state task AAAA-A21-121011290003-0.

The results of the method when detecting noises from natural and technogenic origin

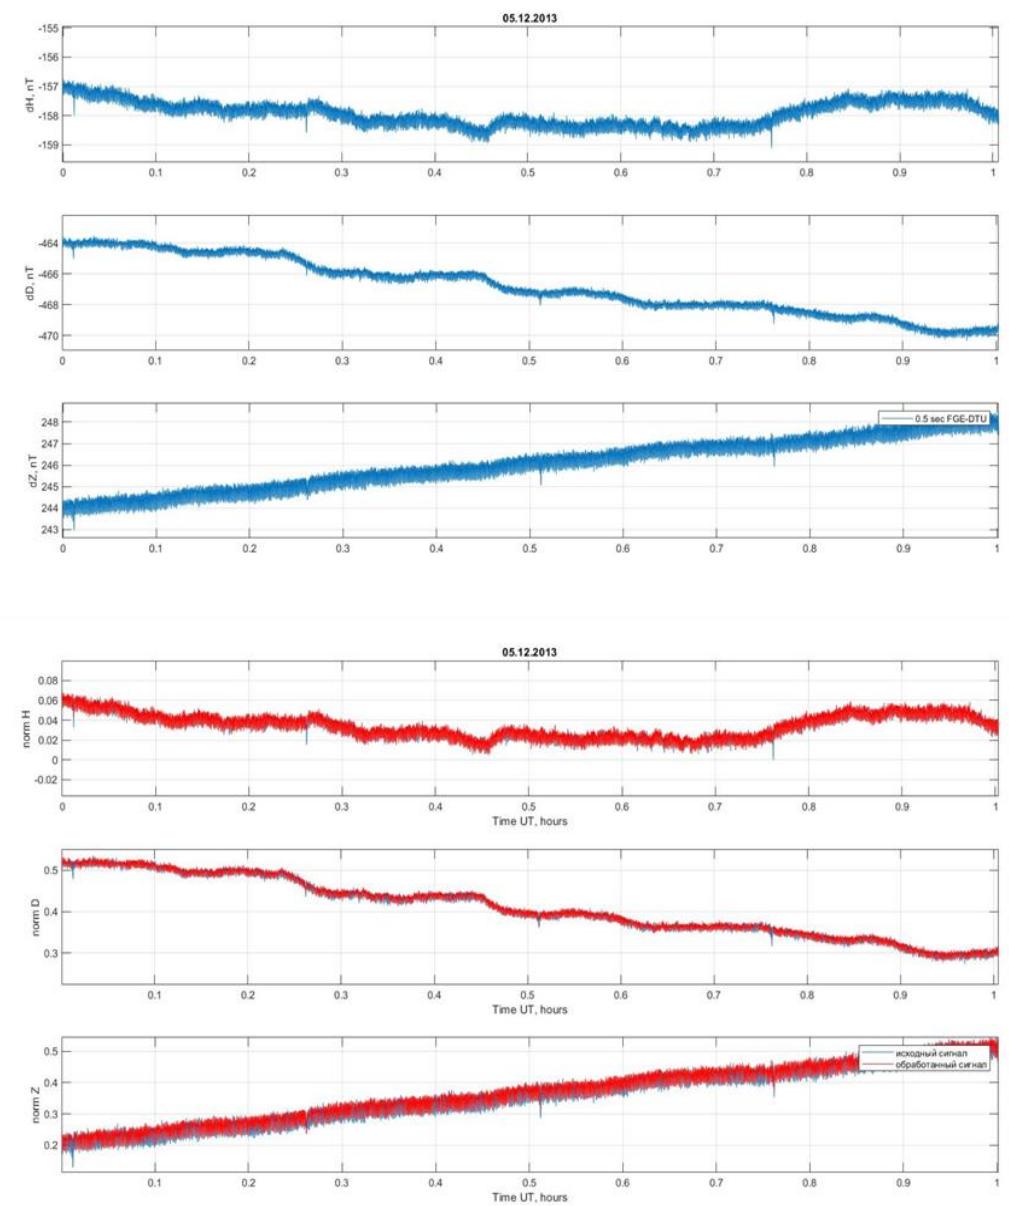

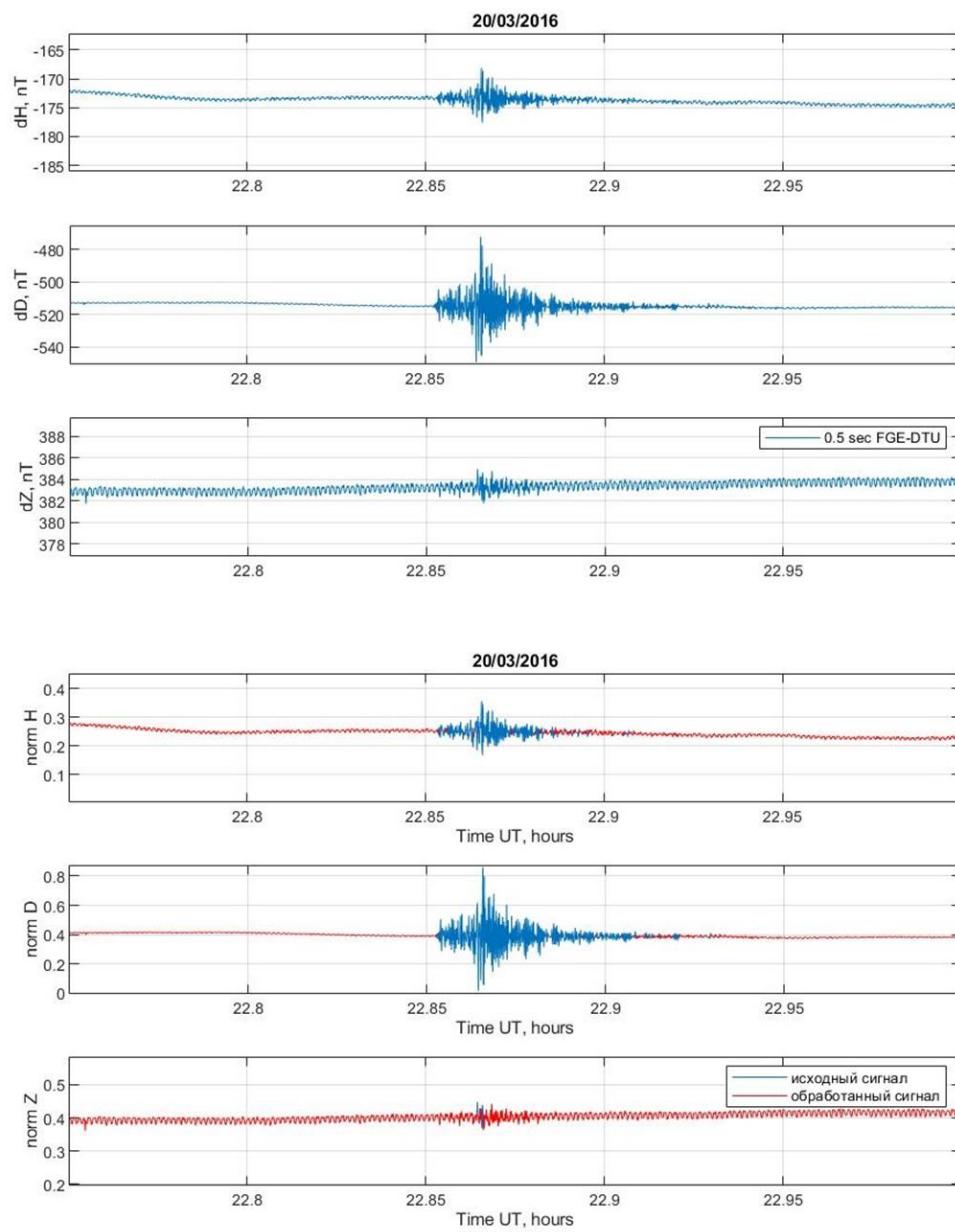

Table 1. ***The error of the method in the selection of noises of natural origin at $T = E_{max}$***

$$\delta = \frac{N_e}{N} * 100\%,$$

N_e - number of natural noises not detected by the method at $T = E_{max}$,

N - total number of natural noises per year.
